## 1-G-Coin Problem

Write a program to take value V and we want to make change for V Rs, and we have infinite supply of each of the denominations in Indian currency, i.e., we have infinite supply of (1, 2, 5, 10, 20, 50, 100, 500, 1000) valued coins/notes, what is the minimum number of coins and/or notes needed to make the change.

Input Format:

Take an integer from stdin.

Output Format:

print the integer which is change of the number.

Example Input :

64

Output:

4

Explanation:

We need a 50 Rs note and a 10 Rs note and two 2 rupee coins.

Answer: (penalty regime: 0 %)

```
1 #include<stdio.h>
2 int main(){
3     int v;
4     scanf("%d",&v);
5     int den[]={1000,500,100,50,20,10,5,2,1};
6     int count=0;
7     for(int i=0;i<9;i++){
8         if(v>=den[i]){
9             count+=v/den[i];
10            v%=den[i];
11        }
12    }
13    printf("%d",count);
14 }
```

	Input	Expected	Got	
✓	49	5	5	✓

Passed all tests! ✓

## 2-G-Cookies Problem

Assume you are an awesome parent and want to give your children some cookies. But, you should give each child at most one cookie.

Each child  $i$  has a greed factor  $g[i]$ , which is the minimum size of a cookie that the child will be content with; and each cookie  $j$  has a size  $s[j]$ . If  $s[j] \geq g[i]$ , we can assign the cookie  $j$  to the child  $i$ , and the child  $i$  will be content. Your goal is to maximize the number of your content children and output the maximum number.

**Example 1:**

**Input:**

```
3
1 2 3
2
1 1
```

**Output:**

```
1
```

Explanation: You have 3 children and 2 cookies. The greed factors of 3 children are 1, 2, 3.

And even though you have 2 cookies, since their size is both 1, you could only make the child whose greed factor is 1 content.

You need to output 1.

**Constraints:**

$1 \leq g.length \leq 3 \times 10^4$

$0 \leq s.length \leq 3 \times 10^4$

$1 \leq g[i], s[j] \leq 2^{31} - 1$

```

1  #include<stdio.h>
2  int main() {
3      int n, m;
4      scanf("%d", &n);
5      int g[n];
6      for (int i = 0; i < n; i++)
7          scanf("%d", &g[i]);
8      int i=0,j=0;
9      int count=0;
10     scanf("%d", &m);
11     int s[m];
12     for (int i = 0; i < m; i++)
13         scanf("%d", &s[i]);
14     while(i<n && j<m){
15         if(g[i]>=s[j]){
16             count++;
17             i++;
18             j++;
19         }
20         else{
21             j++;
22         }
23     }
24     printf("%d ",count);
25 }

```

	Input	Expected	Got

## 3-G-Burger Problem

A person needs to eat burgers. Each burger contains a count of calorie. After eating the burger, the person needs to run a distance to burn out his calories.

If he has eaten  $i$  burgers with  $c$  calories each, then he has to run at least  $3^i * c$  kilometers to burn out the calories. For example, if he ate 3 burgers with the count of calorie in the order: [1, 3, 2], the kilometers he needs to run are  $(3^0 * 1) + (3^1 * 3) + (3^2 * 2) = 1 + 9 + 18 = 28$ .

But this is not the minimum, so need to try out other orders of consumption and choose the minimum value. Determine the minimum distance he needs to run. Note: He can eat burger in any order and use an efficient sorting algorithm. Apply greedy approach to solve the problem.

#### Input Format

First Line contains the number of burgers

Second line contains calories of each burger which is  $n$  space-separate integers

#### Output Format

Print: Minimum number of kilometers needed to run to burn out the calories

#### Sample Input

3

5 10 7

#### Sample Output

76

#### For example:

Test	Input	Result
Test Case 1	3	18
	1 3 2	

Answer: (penalty regime: 0 %)

```
1 #include<stdio.h>
2 #include<math.h>
3 #include<stdlib.h>
4 int cmp(const void *a,const void *b){
5     return (*(int*)b-*(int*)a);
6 }
7 int main(){
8     int n;
9     scanf("%d",&n);
10    int a[n];
11    for(int i=0;i<n;i++){
12        scanf("%d",&a[i]);
13    }
14    qsort(a,n,sizeof(int),cmp);
15    int total=0;
16    for(int i=0;i<n;i++){
17        total+=(pow(n,i)*a[i]);
18    }
19    printf("%d ",total);
20
21 }
```

	Test	Input	Expected	Got	
✓	Test Case 1	3 1 3 2	18	18	✓
✓	Test Case 2	4 7 4 9 6	389	389	✓
✓	Test Case 3	3 5 10 7	76	76	✓

Passed all tests! ✓

Correct

## 4-G-Array Sum max problem

Given an array of  $N$  integers, we have to maximize the sum of  $arr[i] * i$ , where  $i$  is the index of the element ( $i = 0, 1, 2, \dots, N$ ). Write an algorithm based on Greedy technique with a Complexity  $O(n \log n)$ .

Input Format:

First line specifies the number of elements  $n$ .

The next  $n$  lines contain the array elements.

Output Format:

Maximum Array Sum to be printed.

Sample Input:

5

2 5 3 4 0

Sample output:

40

Answer: (penalty regime: 0 %)

```
1 #include<stdio.h>
2 #include<stdlib.h>
3 int cmp(const void *a, const void *b){
4     return (*(int*)a - *(int*)b);
5 }
6 int main(){
7     int n;
8     scanf("%d", &n);
9     int arr[n];
10    int total=0;
11    for(int i=0; i<n; i++){
12        scanf("%d", &arr[i]);
13    }
14    qsort(arr, n, sizeof(int), cmp);
15    for(int i=0; i<n; i++){
16        total+=arr[i]*i;
17    }
18    printf("%d", total);
19 }
20
21
22 }
```

	Input	Expected	Got	
✓	5 2 5 3 4 0	40	40	✓
✓	10 2 2 2 4 4 3 3 5 5 5	191	191	✓
✓	2 45 3	45	45	✓

Passed all tests! ✓

**Correct**

Marks for this submission: 1.00/1.00.

## 5-G-Product of Array elements-Minimum

Given two arrays `array_One[]` and `array_Two[]` of same size `N`. We need to first rearrange the arrays such that the sum of the product of pairs( 1 element from each) is minimum. That is  $\sum (A[i] * B[i])$  for all `i` is minimum.

For example:

Input	Result
3	28
1	
2	
4	
8	
6	
9	

Answer: (penalty regime: 0 %)

```

1 #include<iostream.h>
2 #include<stdlib.h>
3 int cmp1(const void *a,const void *b){
4     return (*(int*)a)-*(int*)b);
5 }
6 int cmp2(const void *a,const void *b){
7     return (*(int*)a)-*(int*)b);
8 }
9 int main(){
10     int n;
11     scanf("%d",&n);
12     int arr1[n],arr2[n];
13     for(int i=0;i<n;i++){
14         scanf("%d",&arr1[i]);
15     }
16     for(int j=0;j<n;j++){
17         scanf("%d",&arr2[j]);
18     }
19     qsort(arr1,n,sizeof(int),cmp1);
20     qsort(arr2,n,sizeof(int),cmp2);
21     int total=0;
22     for(int i=0,j=0;i<n;i++,j++){
23         total+=arr1[i]*arr2[j];
24     }
25     printf("%d",total);
26 }

```
